The second edition of the Analysis of the Assessment of the Propensity of Shenyang Guo and Mark W. Fraser is an excellent book on assessing the effects of treatment from observational data. Researchers and graduate students interested in analyzing observational data will find this book invaluable. This book is the first to provide step-by-step instruction on the use of Stata to assess the effects of treatment by analyzing the propensity to score. In addition, this book also covers Heckman's sample of sample appraisers, nearest neighbor matching appraisers, propensity to score compliance, and propensity to evaluate non-parametric regression of appraisers. After providing a useful history of these methods, the book includes a discussion of a counterfactual framework to assess the effects of treatment involved in the use of observational data. The authors consolidated the notation and theory found in the literature on inclination, and this notation is carried out throughout the text. This book introduces the philosophy and methods of matching scores in an accessible way, even for those who are not familiar with the subject. Readers embark on an interesting journey from a discussion about the early formulation of the Neiman-Rubin counter-factual structure to a discussion on current research methods and issues. These ideas are discussed at the theoretical and applied levels. The authors of the book officially describe the assumptions underlying the analysis in order to educate readers about the problems associated with applying these methods to practical problems. The analysis of propensity has roots in both the economy and statistics. Economists will find the discussion of heckman's sample selection a familiar one, and statisticians will find Rosenbaum and Rubin's counter-factual framework familiar. The authors do a great job of bringing these two points of view together in a unified, balanced manner. New to the second edition are sections on multi-valued treatments, generalized assessments of the propensity to evaluate, and expanded sections on the assessment of the propensity to weigh. Most of the examples in this book are stata, and many of the evaluators discussed in this new edition are implemented in the teffects team available in Stata 13. Although this book makes an excellent postgraduate text at the observational data analysis level, it is readily available to researchers using observational data to assess the effects of treatment. This book should be compulsory for students to read in economics and statistics. The approach of the authors in writing this book is very effective for beginners and user experience ... This balance between practical and applied approach is a useful model for researchers to understand the process and interpretation of these analyses ... This is a big part of making the methods of bias analysis more accessible, understandable, and useful for psychologists. (Carl N. Kelly PsycCRITUES 2011-07-06)Go and Fraser™ book Inclination Assessment Analysis: Statistical Methods and Applications Is the First a book that discusses and compares different PS methods from a theoretical and practical point of view. One of the strengths of™ is its attention to the application of PS to real data. This tutorial provides a good introduction to PS appropriate methods and some alternative approaches to assess cause-and-effect effects care. With its many examples in Stata, this may be useful for graduate students and applied researchers who have no or limited experience with PS techniques but are familiar with basic regression techniques and mathematical/statistical notation. (Peter M. Steiner PSYCHOMETRICSVOL. 75, No. 4, 775777 2010-12-08) Shenyang Guo, Ph.D., is Professor Emeritus of Curalta at the University of North Carolina School of Social Work. The author of numerous articles on statistical methods and reports on child welfare research, child mental health services, social welfare and health services, Go has experience in applying advanced statistical models to address social security issues and has taught postgraduate studies in history analysis, hierarchical linear modeling, growth curve modeling and programme evaluation. He gave many invited seminars on statistical methods, including analysis of event history and inclination scores at the NIH Summer Institute, the Bureau of Children's™ and at social work and research conferences. He oversaw data analysis planning for the National Child and Adolescent Welfare Survey (NSCAW) longitudinal analysis. Mark W. Fraser, Ph.D., has a Tate Dear Professor at the School of Social Work, University of North Carolina at Chapel Hill, where he serves as Assistant Dean for Research. He has written numerous chapters and articles on risk and sustainability, children's behaviour, child and family services, and research methods. Together with colleagues, he co-authored or edited eight books, including Families in Crisis, Family Care Assessment, Risk and Resilience in Childhood, Choice, Context of Violence Against Youth, and Intervention with Children and Adolescents. Its award-winning text, Social Policy for Children and Families, examines the foundations of public policies on child protection, juvenile justice, mental health, developmental and health problems. His latest book, Intervention Research: Developing Social Programs, describes a design perspective on the development of innovative social and medical programs. Programme evaluation methods have changed significantly over the past 35 years, and researchers have recognized the need to develop more effective approaches to assessing the effects of treatment from observational studies and for evaluations based on quasi-experimental projects. Written by experts, this volume is updated and fully current changes in the area. It offers a systematic overview of the history, origins and statistical underpinnings of the analysis of propensity assessment, and more. -- Neo-Premalinism magazine is published on: Shenyang Guo is the author of numerous scientific articles on child protection, child mental health, social welfare and health. He has experience using advanced statistical models to solve social security problems and has taught graduate school, which solves survival analysis, hierarchical linear modeling, structural modeling of equations, analysis of propensity assessment, and evaluation program. In addition, Go is the editor of SAGE Publication™ Advanced quantitative Techniques in the Social Sciences series and a frequent reviewer of journals seeking to critique advanced methodological analysis. Go is a member of the American Academy of Social Work and Social Security. In addition, Go serves on behalf of the University of Washington as Assistant Vice Chancellor for International Affairs and as Ambassador to McDonnell International Academy in China, working with Fudan University. In 2016, he was appointed China's Minister of Education™ as a professor at the Yangtze River University of the™yang Jiaotong, China.Mark W. Fraser, PhD, has a Tate Emeritus Professor at the School of Social Work, University of North Carolina, where he serves as Assistant Dean for Research. He has received numerous awards for research and teaching, including the Aaron Rosen Award and the Distinguished Achievement Award from the Society for Social Work and Research. His work focuses on risk and sustainability, children's behaviour, child and family services, and research methods. Dr. Fraser has published extensively, and, in addition to social policy towards children and families, is a co-author or editor of eight books. These include Families in Crisis, a study of intensive family-oriented services, and an assessment of family services, a text on family research methods. In Risk and Resilience in Childhood, he and his colleagues describe sustainable perspectives on child abuse, substance abuse, and other social problems. In Making a Choice, Dr. Fraser and his co-authors set out a program to help children build sustainable social relationships. In the context of youth violence, he explores violence in terms of resilience, risk and protection, as well as intervention with children and adolescents, Dr. Fraser and his colleagues look at advances in learning about intervention in social and health problems. Intervention Research: The development of social programs describes the development and development of social programs. His latest book is Inclination Assessment Analysis: Statistical Techniques and Applications. Dr Fraser is the editor of the Society for Social Work and Research. He is a member of the National Academy of Practice and the American Academy of Social Work and Social Security. Welfare.
